

## CS1470/2470: How to hand in assignments

1. Run the zip script in the directory where your assignment.py file is with the following command: `./zip.sh`
  - a. This should produce a .zip file, named hw#\_your\_login.
  - b. Please be sure to use the .zip file that is specific to the current homework. It should be in the directory where the stencil is.
2. Move this file **into a new directory** then run the handin script.\*\*\*\*\*
  - a. to make a new directory: `mkdir handin`
  - b. go into this new directory: `cd handin`
  - c. run the handin script: `cs147_handin <project name>`

\*\*\*\*\*This is important because the handin script takes everything from the current directory from which it is run. Running it in the original directory where you ran the zip script will defeat the purpose of zipping all the files.

## FAQ

### ***Why do I have to zip my files?***

Our autograder consumes .zip files and the autograder is how we can get your grades back in a reasonable amount of time. The autograder is also new this year, so please be respectful of our growing pains! We know it's not a perfect system.

### ***What does the zip script do?***

It zips your files for us and ignores any extra stuff in your directory that would kill our storage (and prevent us from grading you!), such as extra data files.
